

PlainT_EX Verbatim

Benjamin T. Shepard

June 29, 2022

An inline verbatim such as `this is \inline` can be made with the code `|...|`. If visible spaces are desired, use `@|...|` instead, which will produce `thisis\inline`. A display verbatim such as

```
this is \display
```

can be made with `||...||`. If visible spaces are desired, use `@||...||` instead, which will produce

```
thisis\display.
```

Every normal T_EX character (except `|`) as well as all of the special characters can be used inside this environment, as shown in the following example:

```
!$@#%^&*()-+=\ /.,;,'`~th@<is$ ]\bye *is{ #a '1\rho > *\tes<t* \undefined .??"
```

Normally, the pipe character `|` can only be used inside the display verbatim `||...||`. However, the macros `\makepipeother` and `\makepipeactive` turn the character `|` into a normal character and back into an active character, respectively. This can be used as follows:

```
1 \makepipeother
2 || this is a | pipe ||
3 \makepipeactive
```

There is also the macro `\pipe` which expands to

```
macro: -> \bgroup\string|\egroup
```

displaying the literal `|`. It can be used to, for example, execute

```
{\tt\pipe\pipe...\pipe\pipe}
```

versus

```
\makepipeother{\tt||...||}\makepipeactive
```

which will each display `||...||`. Of course, this macro cannot be used inside the `|...|` or `||...||` environments.

The character `@` is able to be used regularly, and can also be used at the end of lines. Code such as

```
1 this is a t@st
2 @
3
```

```
4 this is a test@  
5  
6 \bye
```

will compile as expected. These verbatim environments also obey spaces, lines, and blank lines.
